

# Logic Synthesis and Verification

Jie-Hong Roland Jiang  
江介宏

Department of Electrical Engineering  
National Taiwan University

Fall 2010

1

## Course Info

### Instructor

Jie-Hong Roland Jiang  
email: [jhjiang@cc.ee.ntu.edu.tw](mailto:jhjiang@cc.ee.ntu.edu.tw)  
office: 242, EEII  
phone: (02)3366-3685  
office hour: 12:20-14:20, Wed

### Course webpage

<http://cc.ee.ntu.edu.tw/~jhjiang/instruction/courses/fall10lsv/lsv.html>

### Email contact

Your official NTU email addresses will be used for future contact

2

## Grading Policy

### Grading rules

- Homework 30%
- Programming assignments 10%
- Midterm 30%
- Project 30%
  - Presentation 5%
  - Final report 25%

### Homework

- discussions encouraged, but write down solutions individually and separately
- due one week from the problem set is out except for programming assignments (due date will be specified)
- 20% off per day for late homework
- 6 homework assignments (peer-review grading)

### Midterm

- in-class exam (schedule may/may not differ from the academic calendar)

### Project

- oral presentation, final report

Report grading errors within one week after receiving notice.

Plagiarism and cheating are strictly prohibited (no credits for plagiarism).

5

## Introduction

Reading:  
*Logic Synthesis in a Nutshell.*  
Section 1

6

## Evolving Information Technology

- The Industrial Revolution
  - Application of power-driven machinery to manufacturing (1750 – 1830)
- IT Revolution
  - Application of electronic devices to information processing (1950 – present)
- Electronic systems evolve in a fascinating speed
  - Design challenges emerge and design paradigms shift in this evolution
  - EDA tools change along the evolution

7

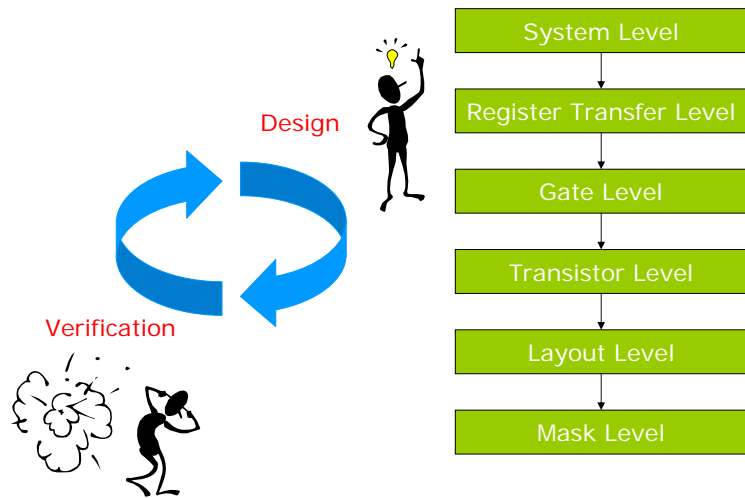

## Electronic Design Automation

- EDA tools aim at automating electronic system design and optimizing *most* design instances (not just some specific design)
- EDA is a field with rich applications from electrical engineering, computer science, and mathematics
  - Electronics, circuit theory, communication, DSP, device physics, ...
  - Algorithms, complexity theory, automata theory, logics, games, ...
  - Probability, statistics, algebra, numerical analysis, matrix computation, ...
- EDA is one of the most advanced areas in practical computer science
  - Many problems require sophisticated mathematical modeling
  - Many algorithms are computationally hard, and require advanced heuristics to work on realistic problem sizes
- EDA is a very good workplace for software engineers
  - E.g., modern SAT solvers (GRASP, Chaff, BerkMin, MiniSAT) are developed in the field of EDA

8

# VLSI Design Flow & Abstraction Levels

# System Level

- Abstract algorithmic description of high-level behavior
  - E.g., C-programming language
 

```

Port*
compute_optimal_route_for_packet(Packet_t *packet,
                                Channel_t *channel)
{
    static Queue_t *packet_queue;

    packet_queue = add_packet(packet_queue, packet);
    ...
}
                    
```
  - abstract because it does not contain any implementation details for timing or data
  - efficient to get a compact execution model as first design draft
  - difficult to maintain throughout project because no link to implementation

# Register Transfer Level

- Cycle accurate model “close” to the hardware implementation
  - bit-vector data types and operations as abstraction from bit-level implementation
  - sequential constructs (e.g. if - then - else, while loops) to support modeling of complex control flow

```

module mark1;
reg [31:0] m[0:8192];
reg [12:0] pc;
reg [31:0] acc;
reg[15:0] ir;
always
begin
    ir = m[pc];
    if(ir[15:13] == 3b'000)
        pc = m[ir[12:0]];
    else if (ir[15:13] == 3'b010)
        acc = -m[ir[12:0]];
    ...
end
endmodule
    
```

# Gate Level

- Model on finite-state machine level
  - models function in Boolean logic using registers and gates
  - various delay models for gates and wires

## Transistor Level

- Model on CMOS transistor level
  - Binary switches used for function modeling
    - E.g., in functional equivalence checking
  - Differential equations used for circuit simulation
    - E.g., in timing/waveform analysis

by courtesy of A. Kuehlmann 13

## Layout Level

- Transistors and wires are laid out as polygons in different technology layers such as diffusion, poly-silicon, metal, etc.

by courtesy of A. Kuehlmann 14

## Integrated System Design

by courtesy of A. Kuehlmann 15

## General Design Approaches

- Divide and conquer !
  - partition design problem into many sub-problems which are manageable
  - define mathematical model for sub-problem and find an algorithmic solution
    - beware of model limitations and check them !
  - implement algorithm in individual design tools, define and implement general interfaces between the tools
  - implement checking tools for boundary conditions
  - concatenate design tools to general design flows which can be managed
  - see what doesn't work and start over

by courtesy of A. Kuehlmann 16

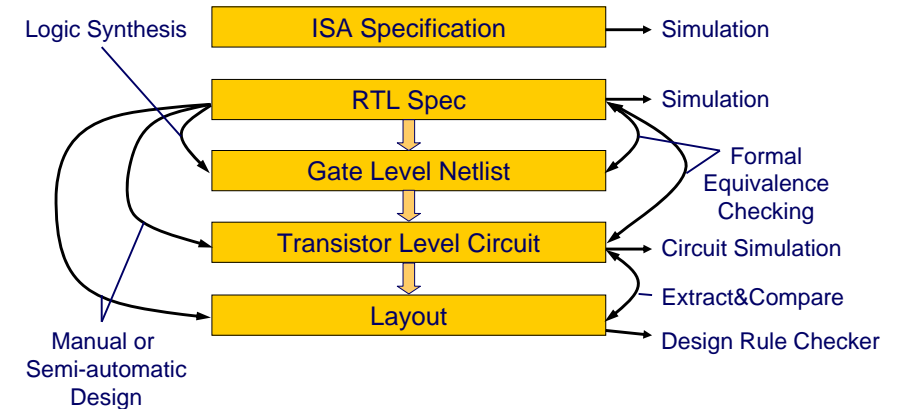

## Full Custom Design Flow

- Application: ultra-high performance designs
  - general-purpose processors, DSPs, graphic chips, internet routers, game processors, etc.
- Target: very large markets with high profit margins
  - e.g. PC business
- Complexity: very complex and labor intense
  - involving large teams
  - high up-front investments and relatively high risks
- Role of logic synthesis:
  - limited to components that are not performance critical or that might change late in design cycle (due to design bugs found late)
    - control logic
    - non-critical data-path logic
  - bulk of data-path components and fast control logic are manually crafted for optimal performance

by courtesy of A. Kuehlmann 17

## Full Custom Design Flow

(incomplete picture)

by courtesy of A. Kuehlmann 18

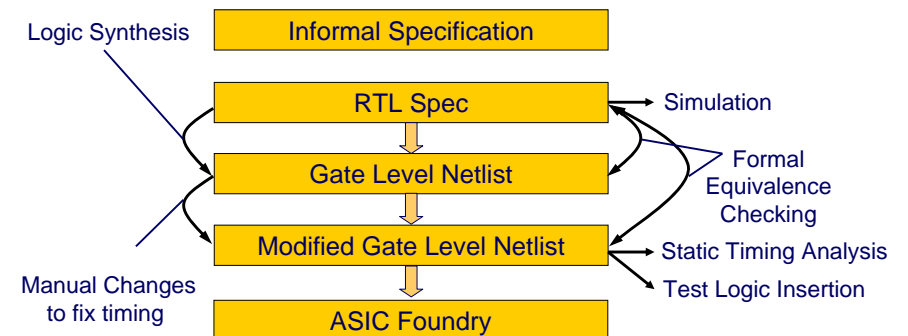

## ASIC Design Flow

- Application: general IC market
  - peripheral chips in PCs, toys, handheld devices, etc.
- Target: small to medium markets, tight design schedules
  - e.g. consumer electronics
- Complexity of design: standard design style, quite predictable
  - standard flows, standard off-the-shelf tools
- Role of logic synthesis:
  - used on large fraction of design except for special blocks such as RAM's, ROM's, analog components

by courtesy of A. Kuehlmann 19

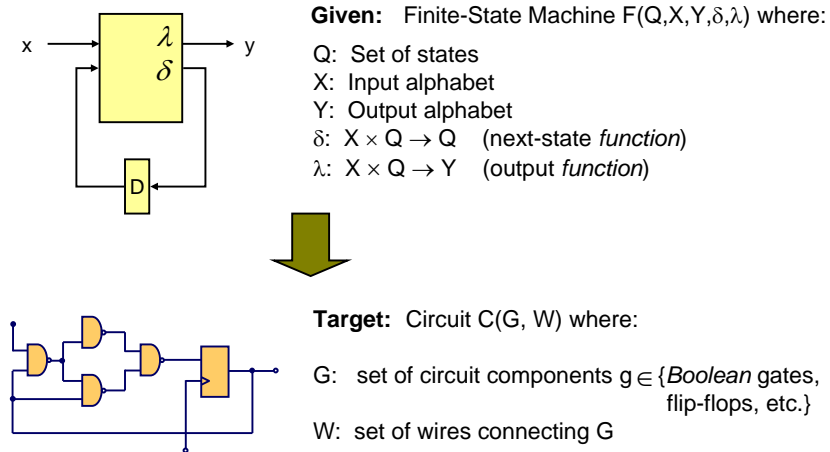

## ASIC Design Flow

(incomplete picture)

20

## What Is Logic Synthesis About?

by courtesy of A. Kuehlmann 21

## Why Is Logic Synthesis Useful?

- Core logic optimization technique in today's EDA flows for IC and system design
- Broad applications in hardware model checking, software verification, program synthesis, and other areas besides circuit optimization
  - Synthesis and verification are two sides of the same coin
- Good subject to get acquainted to Boolean reasoning

22

## Brief History

- 1847: Boole's "algebra of logic"
- 1937: Shannon's M.S. thesis, *A Symbolic Analysis of Relay and Switching Circuits*
- 1950s: Quine's minimization theory of Boolean formulas
- 1958: Kilby's invention of IC
- 1960s: ATPG D-Algorithm for Boolean reasoning
- 1970s: two-level logic minimization for PLA,
  - IBM introduced formal equivalence checking in computer design in 1978 and logic synthesis for gate array based design in 1979
- 1980s: multi-level logic minimization, FSM optimization, technology mapping, BDD, symbolic equivalence checking
  - Synopsys founded in 1986
    - first product "remapper" between standard cell libraries
- 1990s: sequential circuit optimization, don't care computation, FPGA synthesis, SAT, low-power synthesis, physical-aware logic synthesis, hardware property checking
  - More companies founded including Ambit, Compass, Synplicity, Magma, Monterey, ...
- 2000s: large-scale logic synthesis, synthesis for reliability, synthesis for emerging technologies, statistical analysis and optimization

23

## Course Outline

- Representation of Boolean functions and basic algorithms
  - Boolean functions, formulas, circuits, SOP and POS representations, BDDs
  - Efficient data structures and algorithms for Boolean reasoning
- Combinational circuit optimization
  - Technology-independent two-level/multi-level logic optimization
  - Technology mapping
- Timing analysis and optimization
- Sequential circuit optimization
  - Clock skewing, retiming and resynthesis
- Formal verification
  - Reachability analysis
  - Formal equivalence checking
  - Safety property checking
- Logic synthesis and verification tool
  - ABC
