Comparison of Several Multivariate Means

Shyh-Kang Jeng

Department of Electrical Engineering/ Graduate Institute of Communication/ Graduate Institute of Networking and Multimedia

Outline

- Introduction
- Comparison of Univariate Means
- Paired Comparisons and a Repeated Measures Design
- Comparing Mean Vectors from Two Populations
- Comparison of Several Univariate
 Population Mean (One-Way ANOVA)

Outline

- Comparing Several Multivariate Population Means (One-Way MANOVA)
- Simultaneous Confidence Intervals for Treatment Effects
- Testing for Equality of Covariance Matrices
- Two-Way ANOVA
- Two-Way Multivariate Analysis of Variance

Outline

- Profile Analysis
- ANOVA for Repeated Measures
- Perspectives and Strategy for Analyzing Multivariate Models

Outline

- Introduction
- Comparison of Univariate Means
- Paired Comparisons and a Repeated Measures Design
- Comparing Mean Vectors from Two Populations
- Comparison of Several Univariate
 Population Mean (One-Way ANOVA)

Introduction

 Extend previous ideas to handle problems involving the comparison of several mean vectors

Outline

- Introduction
- Comparison of Univariate Means
- Paired Comparisons and a Repeated Measures Design
- Comparing Mean Vectors from Two Populations
- Comparison of Several Univariate
 Population Mean (One-Way ANOVA)

Questions

- What is the paired comparison?
- How to design experiments for paired comparison?
- How to test if the population means of paired groups are different?
- How to compute the confidence interval for the difference of population means of paired groups?

- How to compare population means of two populations without paired experiments?
- In such a case, how to estimate the common variance?

Scenarios

- To test if the differences are significant between
 - Teaching using Power Point vs. using chalks and blackboard only
 - -Drug vs. placebos
 - Processing speed of MP3 player model I of brand A vs. model G of brand B
 - Performance of students going to cram schools vs. those not

Single Response (Univariate) Case

$$D_j = X_{j1} - X_{j2}, j = 1, 2, \dots, n$$
$$D_j : N(\delta, \sigma_d^2)$$
$$t = \frac{\overline{D} - \delta}{s_d / \sqrt{n}} : t_{n-1}$$
Reject $H_0 : \delta = 0$ in favor of $H_1 : \delta$

Reject $H_0: \delta = 0$ in favor of $H_1: \delta \neq 0$ if $|t| > t_{n-1}(\alpha/2)$ 100(1- α)% confidence interval for δ

13

$$\overline{d} - t_{n-1}(\alpha/2) \frac{s_d}{\sqrt{n}} \le \delta \le \overline{d} + t_{n-1}(\alpha/2) \frac{s_d}{\sqrt{n}}$$

Comparing Means from Two Populations

- Without explicitly controlling for unitto-unit variability, as in the paired comparison case
- Experimental units are randomly assigned to populations
- Applicable to a more general collection of experimental units

Assumptions Concerning the Structure of Data

 $\begin{aligned} X_{11}, X_{12}, \cdots, X_{1n_1} : \text{random sample from univariate} \\ \text{population with mean } \mu_1 \text{ and variance } \sigma_1^2 \\ X_{21}, X_{22}, \cdots, X_{2n_2} : \text{random sample from univariate} \\ \text{population with mean } \mu_2 \text{ and variance } \sigma_2^2 \\ X_{11}, X_{12}, \cdots, X_{1n_1} \text{ are independent of } X_{21}, X_{22}, \cdots, X_{2n_2} \\ \text{Further assumptions when } n_1 \text{ and } n_2 \text{ small :} \\ \text{Both populations are univariate normal} \\ \sigma_1^2 = \sigma_2^2 \end{aligned}$

Outline

- Introduction
- Comparison of Univariate Means
- Paired Comparisons and a Repeated Measures Design
- Comparing Mean Vectors from Two Populations
- Comparison of Several Univariate
 Population Mean (One-Way ANOVA)

19

Questions

- How to make paired comparison for multivariate data?
- How to use the contrast matrix to carry out paired comparison for multivariate data?
- What is the repeated measures?
- How to test for equality of treatments in a repeated measures?

Comparing Mean Vectors from Two Populations

- Populations: Sets of experiment settings
- Without explicitly controlling for unitto-unit variability, as in the paired comparison case

38

- Experimental units are randomly assigned to populations
- Applicable to a more general collection of experimental units

 $\begin{aligned} \mathbf{X}_{11}, \mathbf{X}_{12}, \cdots, \mathbf{X}_{1n_1} : \text{random sample from } p - \text{variate} \\ \text{population with mean vector } \mathbf{\mu}_1 \text{ and covariance } \mathbf{\Sigma}_1 \\ \mathbf{X}_{21}, \mathbf{X}_{22}, \cdots, \mathbf{X}_{2n_2} : \text{random sample from } p - \text{variate} \\ \text{population with mean vector } \mathbf{\mu}_2 \text{ and covariance } \mathbf{\Sigma}_2 \\ \mathbf{X}_{11}, \mathbf{X}_{12}, \cdots, \mathbf{X}_{1n_1} \text{ are independent of } \mathbf{X}_{21}, \mathbf{X}_{22}, \cdots, \mathbf{X}_{2n_2} \\ \text{Further assumptions when } n_1 \text{ and } n_2 \text{ small :} \\ \text{Both populations are multivariate normal} \\ \mathbf{\Sigma}_1 = \mathbf{\Sigma}_2 \end{aligned}$

Pooled Estimate of
Population Covariance Matrix
$$\sum_{j=1}^{n_1} (\mathbf{x}_{j1} - \overline{\mathbf{x}}_1) (\mathbf{x}_{j1} - \overline{\mathbf{x}}_1) \approx (n_1 - 1) \Sigma$$
$$\sum_{j=1}^{n_1} (\mathbf{x}_{j2} - \overline{\mathbf{x}}_2) (\mathbf{x}_{j2} - \overline{\mathbf{x}}_2) \approx (n_2 - 1) \Sigma$$
$$\mathbf{S}_{pooled} = \frac{\sum_{j=1}^{n_1} (\mathbf{x}_{j1} - \overline{\mathbf{x}}_1) (\mathbf{x}_{j1} - \overline{\mathbf{x}}_1) + \sum_{j=1}^{n_2} (\mathbf{x}_{j2} - \overline{\mathbf{x}}_2) (\mathbf{x}_{j2} - \overline{\mathbf{x}}_2)}{n_1 + n_2 - 2}$$
$$= \frac{n_1 - 1}{n_1 + n_2 - 2} \mathbf{S}_1 + \frac{n_2 - 1}{n_1 + n_2 - 2} \mathbf{S}_2$$

Multivariate Behrens-Fisher Problem

- * Test $H_0: \mu_1 \mu_2 = 0$
- Population covariance matrices are unequal
- Sample sizes are not large
- Populations are multivariate normal

56

 Both sizes are greater than the number of variables

Questions

- Why paired comparisons are not good ways to compare several population means?
- How to compute summed squares (between)?
- How to compute summed squares (within)?
- How to compute summed squares (total)?

Questions

- How to calculate the degrees of freedom for summed squares (between)?
- How to calculate the degrees of freedom for summed squares (within)?
- How to calculate the degrees of freedom for summed squares (total)?

Questions

- How to compute the F value for testing of the null hypothesis?
- How are the three kinds of summed squares related?
- How to explain the geometric meaning of the degrees of freedom for a treatment vector?
- What is an ANOVA table?

Scenarios

- To test if the following statements are plausible
 - Music compressed by four MP3 compressors are with the same quality
 - Three new drugs are all as effective as a placebo
 - -Four brands of beer are equally tasty
 - Lectures, group studying, and computer assisted instruction are equally effective for undergraduate students

64

Comparing Four MP3 Compressors

- ✤Test four brands, A, B, C, D
- 10 subjects each brand (40 in total) to provide a satisfaction rating on a 10-point scale
- Assume that the rating to each brand is a normal distribution, but all four distributions are with the same variance

5

61

Hypotheses

Null hypothesis

$$H_0: \mu_A = \mu_B = \mu_C = \mu_D$$

- Alternative hypothesis
 - H_1 : Not all the μ s are equal

Problem of Using a *t*-Test

- Must compare two brands at a time
- There are 6 possible comparisons
- Each has a 0.05 chance of being significant by chance
- Overall chance of significant result, even when no difference exist, approaches $1-(0.95)^6 \sim 0.26$

67

Sample Data

Subject	А	В	С	D
1	4	5	7	2
2	4	5	8	1
3	5	6	7	2
4	5	6	9	3
5	6	7	6	3
6	3	6	3	4
7	4	4	2	5
8	4	5	2	4
9	3	6	2	4
10	4	3	3	3
Mean	4.2	5.3	4.9	3.1

Thinking in Terms of Signals and Noises

- - Overall difference among the means of the groups
 - Sum of all the squared differences between group means and the overall means
- Noises
 - $-\operatorname{Overall}$ variability within the groups
 - Sum of all the squared differences between individual data and their group means

Sum of Squares (Between)

 $SS(between) = n \sum (\bar{x}_{\ell} - \bar{x})^{2}$ $SS(between) = 10[(4.2 - 4.375)^{2} + (5.3 - 4.375)^{2} + (4.9 - 4.375)^{2} + (3.1 - 4.375)^{2}]$ = 27.875

Sum of Squares (Within)

$$SS(within) = \sum_{\ell} \sum_{j} \left(x_{\ell j} - \bar{x}_{\ell} \right)^{2}$$

$$SS(within) = (4 - 4.2)^{2} + (4 - 4.2)^{2} + \dots + (4 - 4.2)^{2} + (5 - 5.3)^{2} + (5 - 5.3)^{2} + \dots + (3 - 5.3)^{2} + (7 - 4.9)^{2} + (8 - 4.9)^{2} + \dots + (3 - 4.9)^{2} + (2 - 3.1)^{2} + (1 - 3.1)^{2} + \dots + (3 - 3.1)^{2}$$

$$[40 \text{ terms}]$$

$$= 101.50$$

Sum of Squares (Total)

$$SS(total) = \sum_{\ell} \sum_{j} (x_{\ell j} - \bar{x})^{2}$$

$$x_{\ell j} - \bar{x} = (x_{\ell j} - \bar{x}_{\ell}) + (\bar{x}_{\ell} - \bar{x})$$

$$(x_{\ell j} - \bar{x})^{2} = (x_{\ell j} - \bar{x}_{\ell})^{2} + 2(x_{\ell j} - \bar{x}_{\ell})(\bar{x}_{\ell} - \bar{x}) + (\bar{x}_{\ell} - \bar{x})^{2}$$

$$\sum_{j} (x_{\ell j} - \bar{x}_{\ell}) = 0$$

$$\sum_{j} (x_{\ell j} - \bar{x})^{2} = \sum_{j} (x_{\ell j} - \bar{x}_{\ell})^{2} + n(\bar{x}_{\ell} - \bar{x})^{2}$$

$$SS(total) = SS(within) + SS(between)$$

Distribution of F

 $F = \frac{SS(between) / df(between)}{SS(within) / df(within)}:$ F distribution of degree of freedoms df(between) and df(within)

$\begin{aligned} & \text{Expected Values of sum of the set of t$

Degrees of Freedom

df (between) = g - 1 = 4 - 1 = 3 df (within) = g(n - 1) = 4(10 - 1) = 36 df (total) = gn - 1 = gn - g + g - 1 = df (within) + df (between)= 40 - 1 = 39 = 36 + 3

ANOVA Summary

Source	Sum of	df	Mean	F
	Squares		square	
Between	27.875	3	9.292	3.296
Within	101.500	36	2.819	
Total	129.375	39		
				82

Hypothesis Testing

 $F = 3.296 > F_{3,36}(0.05) = 2.86$ reject $H_0: \mu_A = \mu_B = \mu_C = \mu_D$ at 0.05 significance level

Univariate ANOVA

 $\begin{aligned} X_{\ell 1}, X_{\ell 2}, \cdots, X_{\ell n_{\ell}} : \text{random sample from } N(\mu_{\ell}, \sigma^2) \\ \ell = 1, 2, \cdots, g \\ \text{Null hypothesis } H_0 : \mu_1 = \mu_2 = \cdots = \mu_g \\ \text{Reparameterization} \\ \mu_{\ell} = \mu + \tau_{\ell} \\ H_0 : \tau_1 = \tau_2 = \cdots = \tau_g = 0 \\ X_{\ell j} = \mu + \tau_{\ell} + e_{\ell j}, \quad e_{\ell j} : N(0, \sigma^2), \quad \sum_{\ell=1}^g n_{\ell} \tau_{\ell} = 0 \\ x_{\ell j} = \overline{x} + (\overline{x}_{\ell} - \overline{x}) + (x_{\ell j} - \overline{x}_{\ell}) \end{aligned}$

$$\begin{aligned} & \text{Univariate ANOVA} \\ & (x_{ij} - \bar{x})^2 = (\bar{x}_{\ell} - \bar{x})^2 + (x_{ij} - \bar{x}_{\ell})^2 + 2(\bar{x}_{\ell} - \bar{x})(x_{ij} - \bar{x}_{\ell}) \\ & \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x}_{\ell}) = 0 \\ & \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x})^2 = n_{\ell} (\bar{x}_{\ell} - \bar{x})^2 + \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x}_{\ell})^2 \\ & \sum_{\ell=1}^{g} \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x})^2 = \sum_{\ell=1}^{g} n_{\ell} (\bar{x}_{\ell} - \bar{x})^2 + \sum_{\ell=1}^{g} \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x}_{\ell})^2 \\ & (SS_{cor}) = (SS_{tr}) + (SS_{res}) \\ & \sum_{\ell=1}^{g} \sum_{j=1}^{n_{\ell}} x_{ij}^2 = (n_{1} + n_{2} + \dots + n_{\ell}) \bar{x}^2 + \sum_{\ell=1}^{g} n_{\ell} (\bar{x}_{\ell} - \bar{x})^2 + \sum_{\ell=1}^{g} \sum_{j=1}^{n_{\ell}} (x_{ij} - \bar{x}_{\ell})^2 \\ & (SS_{obs}) = (SS_{mean}) + (SS_{tr}) + (SS_{res}) \end{aligned}$$

Concept of Degrees of Freedom $1 = [1, \dots, 1] = u_1 + u_2 + \dots + u_g$ Treatment vector and 1 are all on the hyperplane

spanned by $\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_g : d.f. g$ **1** is perpendicular to the treatment vector \therefore mean vector $\overline{x}\mathbf{1}: d.f. g - 1$ Residual vector $\mathbf{e} = \mathbf{y} - \overline{x}\mathbf{1} - [(\overline{x}_1 - \overline{x})\mathbf{u}_1 + (\overline{x}_2 - \overline{x})\mathbf{u}_2 + \dots + (\overline{x}_g - \overline{x})\mathbf{u}_g]$ perpendicular to the hyperplane spanned by $\mathbf{u}_1, \mathbf{u}_2, \dots, \mathbf{u}_g$ \therefore d.f. of $\mathbf{e}: n - g$

Outline

- <u>Comparing Several Multivariate</u>
 <u>Population Means (One-Way</u>
 <u>MANOVA</u>)
- Simultaneous Confidence Intervals for Treatment Effects
- Testing for Equality of Covariance Matrices
- Two-Way ANOVA
- Two-Way Multivariate Analysis of Variance

Questions

- What is the one-way MANOVA table?
- How to compute Wilk's lambda for MANOVA?
- How to test the equality of several mean vectors from the Wilk's lambda?
- How to test the equality of several mean vectors for large sample size?

92

Questions

 What are other statistics used in statistical software package for oneway MANOVA?

Scenario: Example 6.10, Nursing Home Data

- Nursing homes can be classified by the owners: private (271), non-profit (138), government (107)
- Costs: nursing labor, dietary labor, plant operation and maintenance labor, housekeeping and laundry labor
- To investigate the effects of ownership on costs

One-Way MANOVA

Population 1: $\mathbf{X}_{11}, \mathbf{X}_{12}, \dots, \mathbf{X}_{1n_1}$ Population 2: $\mathbf{X}_{21}, \mathbf{X}_{22}, \dots, \mathbf{X}_{2n_2}$

: :

Population $g: \mathbf{X}_{g1}, \mathbf{X}_{g2}, \cdots, \mathbf{X}_{gn_g}$

MANOVA (Multivariate ANalysis Of VAriance) is used to investigate whether the population mean vectors are the same, and, if not, which mean components differ significantly

Assumptions about the Data X_{ℓ1}, X_{ℓ2}, ..., X_{ℓnℓ}: random sample from a population with mean μ_ℓ, ℓ = 1, 2, ..., g Random sample from different populations are independent All populations have a common covariance matrix Σ Each population is multivariate normal

Bonferroni Intervals for
Treatment Effects

$$\hat{\tau}_{ki} = \bar{x}_{ki} - \bar{x}_{i}, \quad \hat{\tau}_{ki} - \hat{\tau}_{\ell i} = \bar{x}_{ki} - \bar{x}_{\ell i}$$

$$\operatorname{Var}(\hat{\tau}_{ki} - \hat{\tau}_{\ell i}) = \operatorname{Var}(\bar{x}_{ki} - \bar{x}_{\ell i}) = \left(\frac{1}{n_{k}} + \frac{1}{n_{\ell}}\right) \sigma_{ii}$$

$$\mathbf{W} = (n_{1} - 1)\mathbf{S}_{1} + (n_{2} - 1)\mathbf{S}_{2} + \dots + (n_{g} - 1)\mathbf{S}_{g}$$

$$= (n - g)\mathbf{S}_{pooled} \approx (n - g)\mathbf{\Sigma}$$

$$\operatorname{Var}(\hat{\tau}_{ki} - \hat{\tau}_{\ell i}) \approx \left(\frac{1}{n_{k}} + \frac{1}{n_{\ell}}\right) \frac{w_{ii}}{(n - g)}$$

$$m = pg(g - 1)/2$$

Comparing Four MP3 Compressors

- *Test four brands, A, B, C, D
- 10 subjects, 5 young and 5 senior, each brand (40 in total) to provide a satisfaction rating on a 10-point scale
- Assume that the rating to each brand is a normal distribution, but all four distributions are with the same variance

		А	В	C	D	Mean
	1~4	4	5	7	2	
	5~8	4	5	8	1	
Young	9~12	5	6	7	2	5.05
Subjects	13~16	5	6	9	3	3.05
	17~20	6	7	6	3	
	Mean	4.8	5.8	7.4	2.2	

		San	ipie	Dala		
		А	В	C	D	Mean
	21~24	3	6	3	4	
	25~28	4	4	2	5	1
Senior Subjects	29~32	4	5	2	4	3.70
	33~36	3	6	2	4	1
	37~40	4	3	3	3]
	Mean	3.6	4.8	2.4	4.0	1
		А	В	C	D	Mean
Brand	Mean	4.2	5.3	4.9	3.1	4.375

Sum of Squares (Brands)

 $SS(brands) = gn \sum_{k=1}^{b} (\bar{x}_{k} - \bar{x})^{2}$ $SS(brands) = 10[(4.2 - 4.375)^{2} + (5.3 - 4.375)^{2} + (4.9 - 4.375)^{2} + (3.1 - 4.375)^{2}]$ = 27.875

133

Sum of Squares (Within)

$$SS(within) = \sum_{\ell=1}^{g} \sum_{k=1}^{b} \sum_{\gamma=1}^{n} (x_{\ell_{k\gamma}} - \bar{x}_{\ell_k})$$

$$SS(within) = (4 - 4.8)^2 + (4 - 4.8)^2 + \dots + (6 - 4.8)^2 + (5 - 5.8)^2 + (5 - 5.8)^2 + \dots + (7 - 5.9)^2 + \dots + (4 - 4.0)^2 + (5 - 4.0)^2 + \dots + (3 - 4.0)^2$$

$$[40 \text{ terms}]$$

$$= 24.80$$

$$\begin{split} E[SS(brand) / df(brand)] \text{ contains } \sigma_{brand}^2, \sigma_{interactions}^2, \sigma_{err}^2 \\ E[SS(within) / df(within)] = \sigma_{err}^2 \\ \text{Thus, if brand effect is significant} \\ \frac{E[SS(brand) / df(brand)]}{E[SS(within) / df(within)]} > 1 \\ F_{brand} > 1 \end{split}$$

Degrees of Freedom

```
\begin{split} df(young / senior) &= g - 1 = 2 - 1 = 1 \\ df(brand) &= b - 1 = 4 - 1 = 3 \\ df(within) &= bg(n - 1) = 8(5 - 1) = 32 \\ df(interactions) &= (b - 1)(g - 1) = (4 - 1)(2 - 1) = 3 \\ df(total) &= bgn - 1 = bg(n - 1) + (b - 1)(g - 1) + b - 1 + g - 1 \\ &= df(within) + df(interactions) + \\ df(brand) + df(young / senior) \\ &= 40 - 1 = 39 = 32 + 3 + 1 \end{split}
```

139

Two-way ANOVA Summary

Source	Sum of	df	Mean	F
	Squares		square	
Brand	27.875	3	9.29	11.99

Questions

- What is the two-way MANOVA table?
- How to determine if the interaction effect exists?
- How to test the effect of each factor by the two-way MANOVA?
- How to determine the Bonferroni confidence intervals if the interaction effect is negligible?

152

Two-Way MANOVA Test for interaction For large samples, reject $H_0: \gamma_{11} = \gamma_{12} = \dots = \gamma_{gb} = 0$ if $-\left[gb(n-1) - \frac{p+1-(g-1)(b-1)}{2}\right] \ln \Lambda^* > \chi^2_{(g-1)(b-1)}(\alpha)$ Wilk's lambda $\Lambda^* = \frac{|SSP_{res}|}{|SSP_{int} + SSP_{res}|}$ If interaction effects exist, the factor effects do not have a clear interpretation

$\begin{array}{c} \mbox{Factor 1: } \mbox{change in rate} \\ \mbox{of extrusion} \end{array} \begin{bmatrix} 1.7405 & -1.5045 & .8555 \\ 1.3005 &7395 \\ .4205 \end{bmatrix} 1 \\ \mbox{Factor 2: } \begin{tabular}{lllllllllllllllllllllllllllllllllll$	Source of variation		SSP		d.1

Questions

- What are repeated measures?
- How to view the data for repeated measures in a two-way ANOVA view?
- How to test the null hypothesis in repeated measures?

175

177

Repeated-Measures ANOVA

- Drugs A, B, C are tested to see if they are equally effective for pain relief
- Subjects are to take all of the drugs, in turn, suitably blinded and after a suitable washout period
- Subjects rate the degree of pain belief on a 1 to 6 scale (1: no relief, 6 complete relief)

176

Avoiding Order Effects

- Randomize the order of treatment
 -1/3 get drug A first, 1/3 get drug B first, 1/3 get drug C first
- People in a long, natural healing course may grow tolerant of the irritant and learn to tune them out
 - -The last medication may work the best
 - -Order effects

Sample Data

Subject	А	В	С	Average
1	5	3	2	3.33
2	5	4	3	4.00
3	5	6	5	5.33
4	6	4	2	4.00
5	6	6	6	6.00
6	4	2	1	2.33
7	4	4	3	3.67
8	4	5	5	4.67
9	4	2	2	2.67
10	5	3	1	3.00
Means	4.80	3.90	3.00	3.90
Adapted from	: G. R. Norma	n and D. L. St	reiner, <i>Biostai</i>	<i>tistics</i> , 3rd ed.

Two-Way ANOVA View Individual subjects as one factor Pain reliever as a second factor Cells are defined by Subjects: 10 levels Drug: 3 levels One observation per cell Special case of two-way ANOVA n = 1, g = 10, b = 3

Sum of Squares (Drug)

 $SS(drug) = g \sum_{k=1}^{p} (\bar{x}_{\bullet k} - \bar{x})^{2}$ $SS(drug) = 10[(4.8 - 3.9)^{2} + (3.9 - 3.9)^{2} + (3.0 - 3.9)^{2}]$ = 16.2

Degrees of Freedom

df (subject) = g - 1 = 10 - 1 = 9 df (drug) = b - 1 = 3 - 1 = 2 df (within) = bg (n - 1) = 0 df (interaction) = (b - 1)(g - 1) = (3 - 1)(10 - 1) = 18 df (total) = bg - 1 = (b - 1)(g - 1) + b - 1 + g - 1 = df (interaction) + df (interaction) + df (drug) + df (subject)= 30 - 1 = 29 = 18 + 2 + 9

ANOVA Table

Source	Sum of	df	Mean	F
	Squares		square	
Drug	16.2	2	8.100	9.225
Subject	36.7	9	4.078	
Drug X Subject	15.8	18	0.878	
Totals	68.7	29		
				186

Hypothesis Testing

 $F_{Drug} = 9.225 > F_{2,18}(0.05) \approx 3.55$ Drug effect is significant (i.e., difference exists)

at 0.05 significance level

ANOVA Table for Same Data as a One-Way ANOVA Test

Source	Sum of Squares	df	Mean square	F
Drug	16.2	2	8.100	4.107
Error	52.5	27	1.944	
Totals	68.7	29		
				188

Comparison of Growth Curves

 $\begin{aligned} \mathbf{X}_{ij} : \text{vector of } p \text{ measurements on subject } j \text{ in group } \ell \\ j = 1, 2, \cdots, n_i; \quad \ell = 1, 2, \cdots, g \\ \mathbf{X}_{ij} : \text{Multivariate normal with covariance } \mathbf{\Sigma} \\ \text{Puthoff - Roy model} \\ E(\mathbf{X}_{ij}) = \begin{bmatrix} \beta_{\ell 0} + \beta_{\ell 1} t_1 + \cdots + \beta_{\ell q} t_1^q \\ \beta_{\ell 0} + \beta_{\ell 1} t_2 + \cdots + \beta_{\ell q} t_2^q \\ \vdots \\ \beta_{\ell 0} + \beta_{\ell 1} t_p + \cdots + \beta_{\ell q} t_p^q \end{bmatrix} = \begin{bmatrix} 1 & t_1 & \cdots & t_1^q \\ 1 & t_2 & \cdots & t_2^q \\ \vdots & \vdots & \ddots & \vdots \\ 1 & t_p & \cdots & t_p^q \end{bmatrix} \begin{bmatrix} \beta_{\ell 0} \\ \beta_{\ell 1} \\ \vdots \\ \beta_{\ell q} \end{bmatrix} \\ = \mathbf{B}_{\mathbf{B}_{\ell}} \end{aligned}$

Example 6.16: Comparing Multivariate and Univariate Tests

Univariate test on x_1 : $F = 2.46 < F_{1,18}(0.10) = 3.01$ Univariate test on x_2 : $F = 2.68 < F_{1,18}(0.10) = 3.01$ Accept $\mu_1 = \mu_2$

Hotelling's test :

$$T^2 = 17.29 > c^2 = \frac{18 \times 2}{17} F_{2,17}(0.01) = 12.94$$

Reject $\mu_1 = \mu_2$

199

Strategy for Multivariate Comparison of Treatments

- Try to identify outliers
 Perform calculations with and without the outliers
- Perform a multivariate test of hypothesis
- Calculate the Bonferroni simultaneous confidence intervals
 For all pairs of groups or treatments, and all characteristics

200

Importance of Experimental Design

- Differences could appear in only one of the many characteristics or a few treatment combinations
- Differences may become lost among all the inactive ones
- Best preventative is a good experimental design
 - Do not include too many other variables that are not expected to show differences
